Dear Washington State Building Code Councilors,

I am writing today on behalf of Zaxium to voice concerns over the Group 2 code package currently up for consideration. I urge the SBCC to remove proposals 032, 058, 059, 060, 062, 063, 065, 066, 079, 080, 089, and 091 from the Group 2 building code package. Further, I would urge adoption of Option 1 of the R406 Table (073) that preserves the ability to choose natural gas for space and water heating.

Washington is one of only three states in the nation operating under the 2018 IECC. 80% of the country is operating on the 2012 code or earlier. While the top ten greenhouse gas emitting states contribute half of the country's total emissions, Washington ranks among the lowest emitting states already.

In its current form, the 2021 code package represents the most stringent code in the nation and will increase the up-front cost of a new home by a minimum of \$24,070, meaning a homeowner will pay \$72,210 for these unfunded mandates over the life of their mortgage. Adding to the cost of constructing new housing units will exacerbate our housing affordability crisis. In Kitsap County, 85% of families already cannot afford to purchase a median priced home.

Further, some of the proposed changes do not make financial sense for my clients. For example the WUI code is extremely expensive. Proposals 058, 059, and 060 includes all provisions of the 2021 WUI code and will increase the cost of constructing new housing units by at least \$31,212, according to estimates from Home Innovation Labs. A homeowner that purchases a home built under the WUI can expect to pay a minimum of \$93,636 over the lifetime of their mortgage.

In addition to the updated building code, builders are fighting skyrocketing costs for building materials, supply chain challenges (such as with compliant heat pumps, reference emergency rule adopted by the SBCC in July of 2022: CR-103E), rising interest rates, and a shortage of qualified workers. At the same time, the HVAC industry specifically is facing changing refrigerant standards, moving from HFC refrigerants to A2L refrigerants. The change in refrigerant standards will reduce the supply of compliant heat pumps available to install in new homes.

I strongly urge the SBCC to remove proposals 032, 058, 059, 060, 062, 063, 065, 066, 079, 080, 089, and 091 from the Group 2 building code package before final passage. Washington builders and homeowners simply cannot afford these code updates.

Sincerely,

Kane Fenner, Principal
